Executive Summary

The crypto trading bot under review exhibited critical flaws in execution, regime identification, and trade ranking, resulting in a net loss of \$-1.5857 (38.7% win rate) despite some accurate high-scoring trades. Liquidity constraints caused significant slippage and rejects (40/62), while regime misidentification led to missed accumulation opportunities. Composite scores were partially accurate but undermined by ranking errors and conservative rejection thresholds.

Performance Summary

Metric	Value
Total Trades	62

Finding	Count
False Positives	0
False Negatives (Missed)	8
Ranking Mistakes	2
Threshold Mistakes	1
Poor Entries	0
Poor Exits	0

Top Issues

- Poor execution quality due to inadequate liquidity and high slippage (40 rejects)
- Regime misidentification causing excessive trade rejections during accumulation phases
- Ranking errors in trade selection (e.g., OP-USDT underperformance despite high score)

Recommended Fixes

- Implement dynamic slippage tolerance and liquidity checks pre-trade to reduce rejects
- Refine regime filters using multi-timeframe analysis to avoid false negatives during accumulation
- Add backtesting validation for composite score rankings to eliminate systematic bias

Quant Analysis

The composite scores for the trades were generally accurate, as the high-scoring trades (SUI-USDT, WIF-USDT, JTO-USDT) performed positively. However, there were ranking mistakes where OP-USDT, with a high composite score of 0.734, was not prioritized correctly, as it was entered after lower-scoring trades. Additionally, INJ-USDT had a composite score of 0.618 but resulted in multiple rejections, indicating it should not have been in the trading tier. The threshold mistake involved the repeated entries of INJ-USDT, which were rejected, suggesting it should not have been considered for trading.

Liquidity Analysis

The trading bot experienced significant execution quality issues during this period, primarily due to inadequate liquidity and high slippage. A large number of 'reject' entries across various pairs (ARB-USDT, TIA-USDT, ORDI-USDT, SUI-USDT, OP-USDT, JTO-USDT, WIF-USDT, BONK-USDT, FLOKI-USDT, INJ-USDT, SEI-USDT, JUP-USDT, PYTH-USDT, ENA-USDT) indicate that the bot frequently failed to fill orders, likely due to insufficient depth at desired price levels or rapid price movements. The 'SPI_COLLAPSE' flag on the SUI-USDT, WIF-USDT, and JTO-USDT exits explicitly points to spread/slippage contributing

Regime Analysis

The trading bot exhibited significant regime misidentification, particularly in rejecting trades during potential accumulation phases. The high number of rejects (40 out of 62) suggests overly conservative regime filters. The SPI_COLLAPSE exits indicate sudden regime shifts weren't anticipated. Composite scores didn't consistently align with actual price action, especially for INJ-USDT which showed high comp scores but was repeatedly rejected.
